

## Abstract

In particle physics there exist two regions: the Standard Model which is fairly complete and the new physics sector which is completely unknown. Inbetween and overlapping with both of these is neutrino physics. Neutrinos exist within the Standard Model but are not explained by it due to the discovery of neutrino oscillations. In this colloquium I will discuss where we stand with neutrino oscillations, where we might go with them, and how we might learn about the nature of neutrinos.

# Knowns and Unknowns in Neutrinos

Symmetry Magazine

Discovering/understanding particles:

- ▶ Photon: easy
- ▶ Charged leptons: easy
- ▶ Heavy quarks: hard experimentally, easy theoretically
- ▶ Light quarks: easy experimentally, harder theoretically
- ▶  $W$  &  $Z$ : hard experimentally, easy theoretically
- ▶ Gluons: easy experimentally, harder theoretically
- ▶ Higgs boson: hard experimentally, easy theoretically
- ▶ Neutrinos: hard experimentally, hard theoretically

# Approach

1. Brief pedagogical review of neutrino oscillations
2. Where we are today with oscillations
3. What kinds of other new physics might be out there

## Neutrino oscillations: the basics

# Do neutrinos have mass?

- ▶ Neutrinos seemed to be massless
- ▶ Direct kinematic searches have still not yielded any indication for a mass

KATRIN [2105.08533](#)

- ▶ The mechanism by which they get mass is unknown!

# How does oscillation work?

A schematic for many environments:

# Some neutrino oscillation theory

Quantum mechanics exercise:

$$i \frac{\partial}{\partial t} |\nu_i\rangle = H |\nu_i\rangle$$

# Some neutrino oscillation theory

Quantum mechanics exercise:

$$i \frac{\partial}{\partial t} |\nu_i\rangle = H |\nu_i\rangle$$

$$H = \begin{pmatrix} E_1 & & \\ & E_2 & \\ & & E_3 \end{pmatrix}$$

$$|\nu_i(t)\rangle = e^{-iEt} |\nu_i(0)\rangle$$

# Some neutrino oscillation theory

Quantum mechanics exercise:

$$i \frac{\partial}{\partial t} |\nu_i\rangle = H |\nu_i\rangle$$

$$H = \begin{pmatrix} E_1 & & \\ & E_2 & \\ & & E_3 \end{pmatrix}$$

$$|\nu_i(t)\rangle = e^{-iEt} |\nu_i(0)\rangle$$

$$E_i \simeq p + \frac{m_i^2}{2p}$$

# Some neutrino oscillation theory

Quantum mechanics exercise:

$$i \frac{\partial}{\partial t} |\nu_i\rangle = H |\nu_i\rangle$$

$$H = \begin{pmatrix} E_1 & & \\ & E_2 & \\ & & E_3 \end{pmatrix}$$

$$|\nu_i(t)\rangle = e^{-iEt} |\nu_i(0)\rangle$$

$$E_i \simeq p + \frac{m_i^2}{2p}$$

Subtract a common phase  $pt$  from all:

$$|\nu_i(t)\rangle = e^{-im_i^2 L/2E} |\nu_i(0)\rangle$$

Note that switching  $E \simeq p$  and  $x \simeq t$  is potentially problematic  
Full QFT calculation gives the same answer

# Some neutrino oscillation theory

Quantum mechanics exercise:

$$i \frac{\partial}{\partial t} |\nu_i\rangle = H |\nu_i\rangle$$

$$H = \begin{pmatrix} E_1 & & \\ & E_2 & \\ & & E_3 \end{pmatrix}$$

$$|\nu_i(t)\rangle = e^{-iEt} |\nu_i(0)\rangle$$

$$E_i \simeq p + \frac{m_i^2}{2p}$$

Subtract a common phase  $pt$  from all:

$$|\nu_i(t)\rangle = e^{-im_i^2 L/2E} |\nu_i(0)\rangle \quad \text{No oscillations!}$$

Note that switching  $E \simeq p$  and  $x \simeq t$  is potentially problematic  
Full QFT calculation gives the same answer

## Production and detection

Need to produce neutrinos in a different basis

QM entanglement!

In the flavor/interaction basis:

$$i \frac{\partial}{\partial t} |\nu_\alpha\rangle = H_f |\nu_\alpha\rangle$$

$$H_f = \frac{1}{2E} U_{\text{PMNS}} \begin{pmatrix} m_1^2 & & \\ & m_2^2 & \\ & & m_3^2 \end{pmatrix} U_{\text{PMNS}}^\dagger$$

## Production and detection

Need to produce neutrinos in a different basis

QM entanglement!

In the flavor/interaction basis:

$$i \frac{\partial}{\partial t} |\nu_\alpha\rangle = H_f |\nu_\alpha\rangle$$

$$H_f = \frac{1}{2E} U_{\text{PMNS}} \begin{pmatrix} m_1^2 & & \\ & m_2^2 & \\ & & m_3^2 \end{pmatrix} U_{\text{PMNS}}^\dagger$$

$U_{\text{PMNS}}$  is: complex,  $3 \times 3$ , unitary; 4 parameters:  $\theta_{23}$ ,  $\theta_{13}$ ,  $\theta_{12}$ ,  $\delta$

Many different ways to parameterize matrix:

U. Dey, N. Nath, S. Sadhukhan [1804.05808](#)   Y. Farzan [1912.09408](#)

Affects oscillations via new matter effect

$$H = \frac{1}{2E} \left[ UM^2 U^\dagger + a \begin{pmatrix} 1 + \epsilon_{ee} & \epsilon_{e\mu} & \epsilon_{e\tau} \\ \epsilon_{e\mu}^* & \epsilon_{\mu\mu} & \epsilon_{\mu\tau} \\ \epsilon_{e\tau}^* & \epsilon_{\mu\tau}^* & \epsilon_{\tau\tau} \end{pmatrix} \right]$$

Matter potential  $a \propto G_F \rho E$

B. Dev, K. Babu, **PBD**, P. Machado, et al. [1907.00991](#)

## Estimate size of effect: magnitude

$$|\epsilon_{e\beta}| \approx \frac{s_{12}c_{12}c_{23}\pi\Delta m_{21}^2}{2s_{23}w_\beta} \left| \frac{\sin \delta_{\text{T2K}} - \sin \delta_{\text{NOvA}}}{a_{\text{NOvA}} - a_{\text{T2K}}} \right| \approx \begin{cases} 0.22 & \text{for } \beta = \mu \\ 0.24 & \text{for } \beta = \tau \end{cases}$$

$a \propto \rho E$

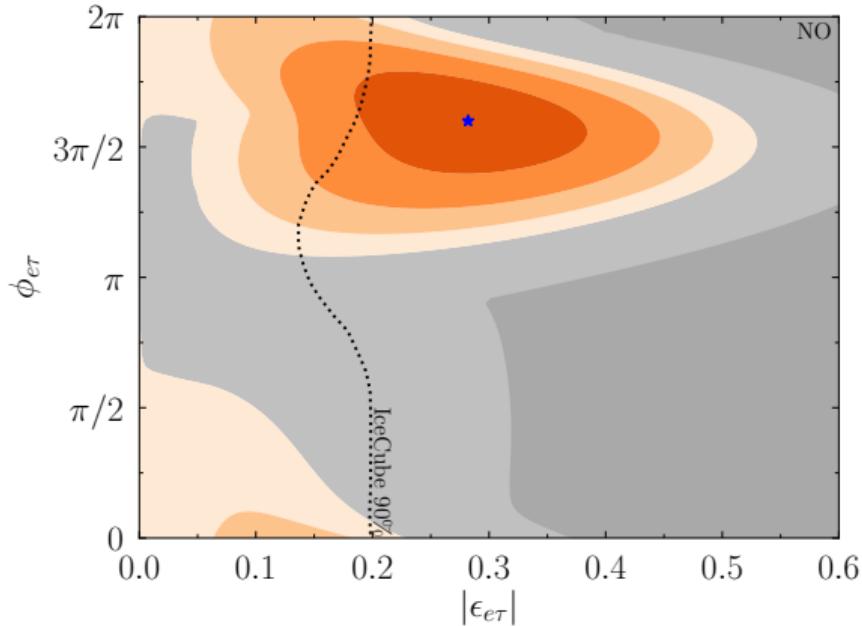

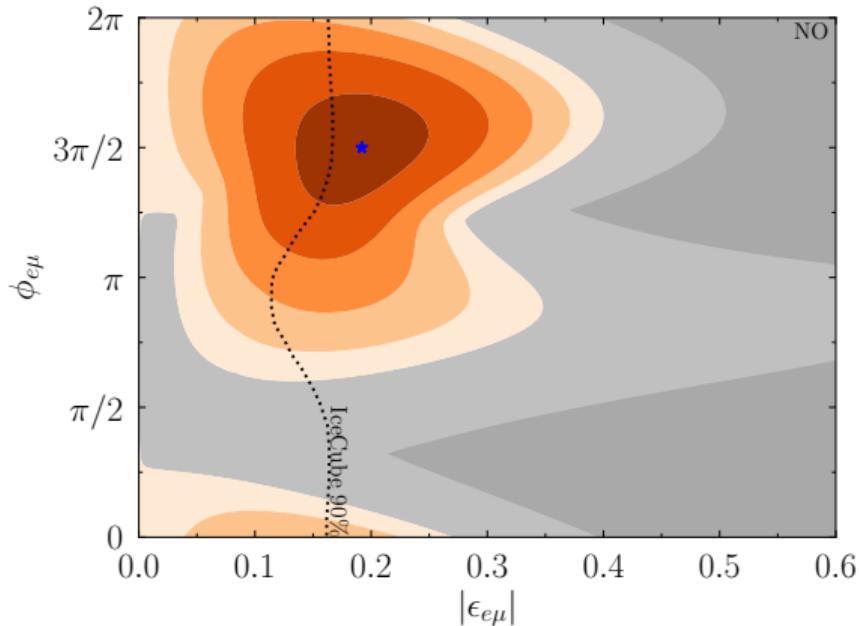

$w_\beta = s_{23}, c_{23}$  for  $\beta = \mu, \tau$

Assumed upper octant  $\theta_{23} > 45^\circ$

Consistency checks:

- ▶  $\sin \delta_{\text{NOvA}} = \sin \delta_{\text{T2K}} \Rightarrow |\epsilon| = 0$
- ▶  $\sin \delta_{\text{NOvA}} \neq \sin \delta_{\text{T2K}}$  and  $a_{\text{NOvA}} = a_{\text{T2K}} \Rightarrow |\epsilon| \rightarrow \infty$
- ▶ Octant:
  1. LBL is governed by  $\nu_3$
  2. Upper octant  $\Rightarrow \nu_3$  is more  $\nu_\mu$
  3. More  $\nu_\mu \Rightarrow$  need less new physics coupling to  $\nu_\mu$  to produce a given effect

# NSI parameters

Orange is preferred over SM at integer values of  $\Delta\chi^2$ , dark gray is disfavored at 4.61

T. Ehrhardt, IceCube [PPNT \(2019\)](#)

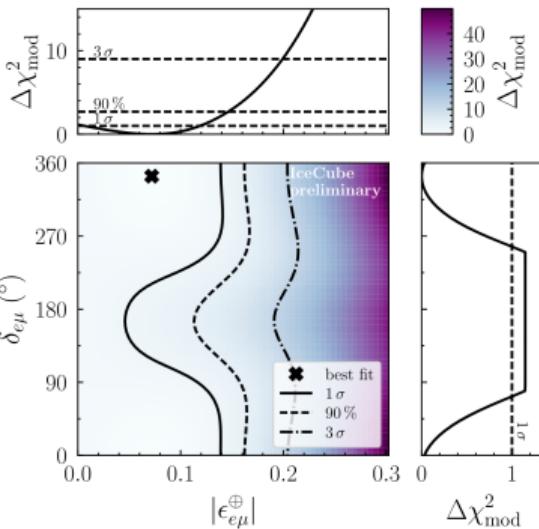

$\epsilon_{\mu\tau}$ , IO in backups

# Other CP violating NSI constraints

NSI effects grow with energy, density, and distance

Best probes:

- ▶  $\epsilon_{\mu\tau}$ : atmospheric
- ▶  $\epsilon_{e\mu}, \epsilon_{e\tau}$ : LBL appearance, atmospheric
- ▶ IceCube
  - ▶ Constraint is at LBL best fit with 3 yrs  
10 yrs of data in the bank
  - ▶ Prefers non-zero  $|\epsilon_{e\mu}|$  at  $\sim 1\sigma$
- ▶ Super-K
  - ▶ Only consider real NSI
  - ▶ Comparable sensitivity as IceCube
- ▶ COHERENT
  - ▶ Only applies to NSI models with  $M_{Z'} \gtrsim 10$  MeV
  - ▶ NSI  $u, d, e$  configuration matters
  - ▶ Comparable constraints

# Unitarity violation

Consistency of the three-flavor oscillation picture?

and/or

Searches for unitarity violation?

# Unitarity violation

Consistency of the three-flavor oscillation picture?

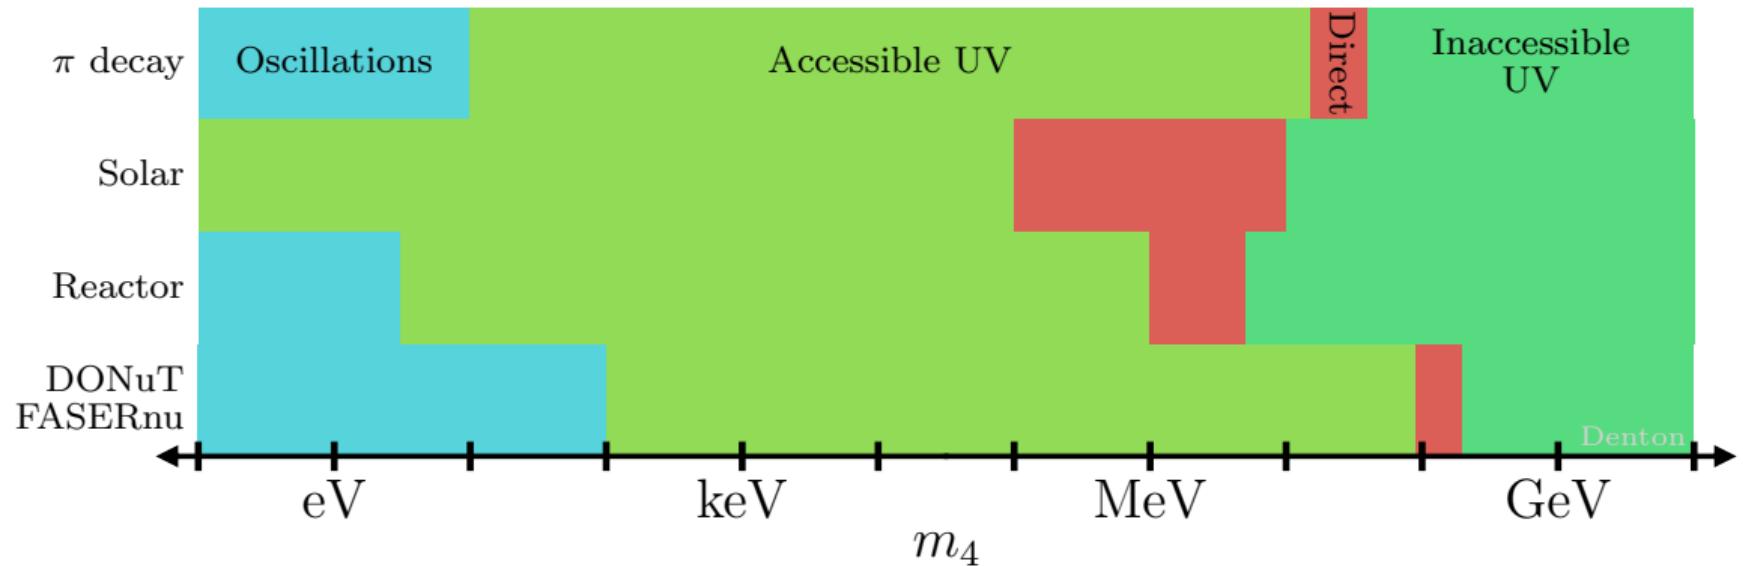

and/or

Searches for unitarity violation?

Not the same!

Lots of models to test standard three-flavor picture:  
Sterile, unitarity violation, NSI, neutrino decay, decoherence, ...

# Unitarity violation: a tale of two regimes

\*Details depends on the specific experiment/channel

# Unitarity violation: what is it?

Our  $3 \times 3$  matrix isn't unitary:

$$U_3 U_3^\dagger \neq \mathbb{1}$$

Addition of new flavor states  $\nu_a, \nu_b, \nu_c, \dots$  and new mass states  $\nu_4, \nu_5, \nu_6$

$$U \rightarrow \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} & \textcolor{red}{U_{e4}} & \cdots \\ U_{\mu 1} & U_{\mu 2} & U_{\mu 3} & \textcolor{red}{U_{\mu 4}} & \cdots \\ U_{\tau 1} & U_{\tau 2} & U_{\tau 3} & \textcolor{red}{U_{\tau 4}} & \cdots \\ \textcolor{red}{U_{a1}} & \textcolor{red}{U_{a2}} & \textcolor{red}{U_{a3}} & U_{a4} & \cdots \\ \vdots & \vdots & \vdots & \vdots & \ddots \end{pmatrix}$$

Unitarity Violation  $\Rightarrow$

New mass states not directly accessible by oscillations or decay  
Thus check if  $U_3$  is what it should be

# Unitarity violation: how to calculate

Kinematically **accessible** states

1. Unitary calculation of full  $n \times n$  matrix
2. Oscillation averaged:

$$\sin^2 \frac{\Delta m_{41}^2 L}{4E} \rightarrow \frac{1}{2}$$

$$\sin \frac{\Delta m_{41}^2 L}{4E} \rightarrow 0$$

3. No matter effect:

$$H^{\text{mat}} = \text{diag}(V_{\text{CC}} + V_{\text{NC}}, V_{\text{NC}}, V_{\text{NC}}, 0, \dots)$$

# Unitarity violation: how to calculate

Kinematically **accessible** states

1. Unitary calculation of full  $n \times n$  matrix
2. Oscillation averaged:

$$\sin^2 \frac{\Delta m_{41}^2 L}{4E} \rightarrow \frac{1}{2}$$

$$\sin \frac{\Delta m_{41}^2 L}{4E} \rightarrow 0$$

3. No matter effect:

$$H^{\text{mat}} = \text{diag}(V_{\text{CC}} + V_{\text{NC}}, V_{\text{NC}}, V_{\text{NC}}, 0, \dots)$$

Kinematically **inaccessible** states

1. Nonunitary calculation of  $m \times m$  matrix  
 $m =$  number of kinematically accessible states
2. Rescale probability:

$$P_{\alpha\beta} = \frac{|\sum_{i=1}^{\text{acc}} U_{\alpha i}^* e^{i P_i L} U_{\beta i}|}{(\sum_{i=1}^{\text{acc}} U_{\alpha i}^* U_{\alpha i})(\sum_{i=1}^{\text{acc}} U_{\beta i}^* U_{\beta i})}$$

3. Cannot subtract multiples of  $\mathbb{1}$
4. Rescale cross section/flux as appropriate
5. Rescale  $G_F$  in matter effect

# Unitarity violation status from oscillations

$3\sigma$  maximal deviations from unitarity

# Neutrino oscillation summary

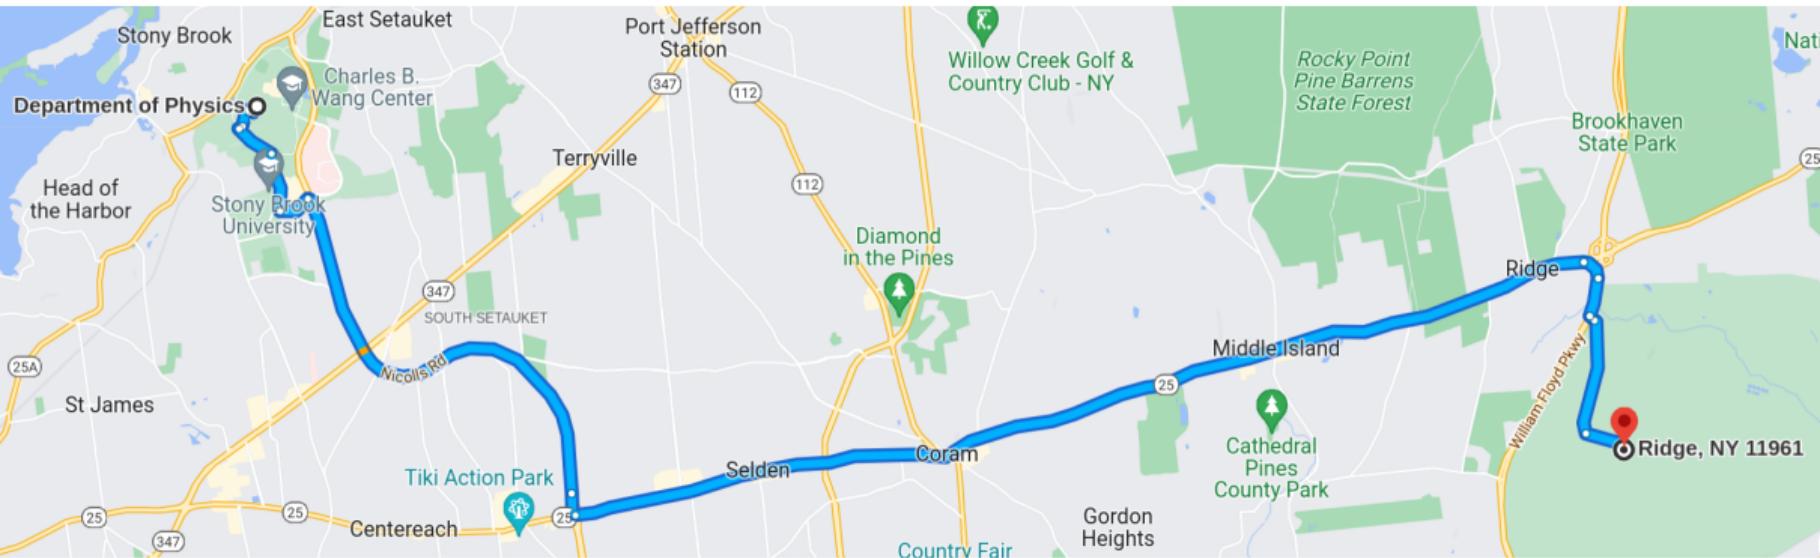

- ▶ Four known unknowns in particle physics: all neutrinos
- ▶ Mass ordering will be measured

Robustness?

- ▶  $\theta_{23}$  octant is important for flavor models
- ▶  $\delta$  could shed light on CP violation
- ▶ Unitarity violation is phenomenologically very rich
- ▶ Lots of existing tau neutrino information to be utilized!

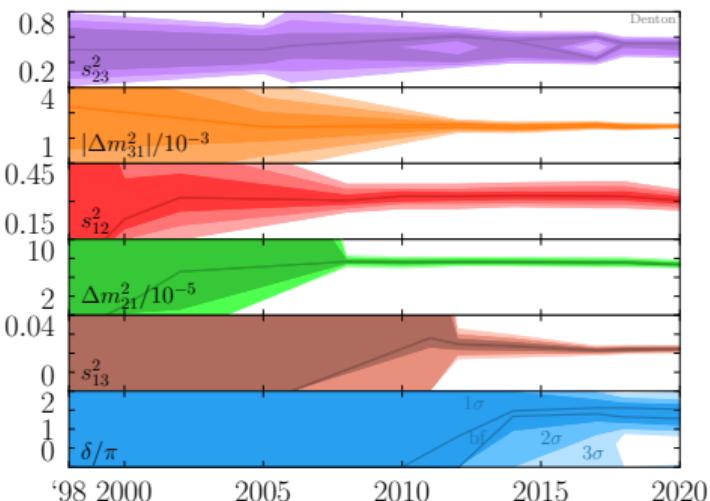

Precision is coming to neutrinos!

# Thanks!

# Complex phase in different parameterizations

- ▶ Can relate the complex phase in one parameterization to that in another
- ▶  $U_{132}$  and  $U_{213}$  similar to  $U_{123}$
- ▶  $\delta$  constrained to  $\sim [150^\circ, 210^\circ]$  in  $U_{231}$ ,  $U_{312}$ ,  $U_{321}$
- ▶ Bands indicate  $3\sigma$  uncertainty on  $\theta_{12}$ ,  $\theta_{13}$ ,  $\theta_{23}$
- ▶ “50% of possible values of  $\delta$ ”  
⇒ parameterization dependent

DUNE TDR II [2002.03005](#)

## Quark mixing

From the PDG,  $V_{\text{CKM}}$  in the  $V_{123}$  parameterization is

$$\theta_{12} = 13.09^\circ \quad \theta_{13} = 0.2068^\circ \quad \theta_{23} = 2.323^\circ \quad \delta_{\text{PDG}} = 68.53^\circ$$

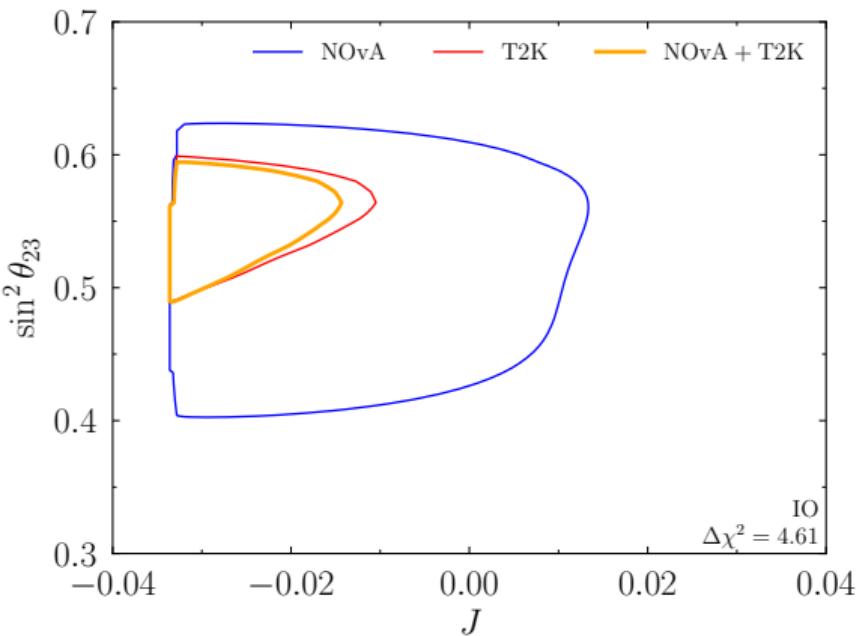

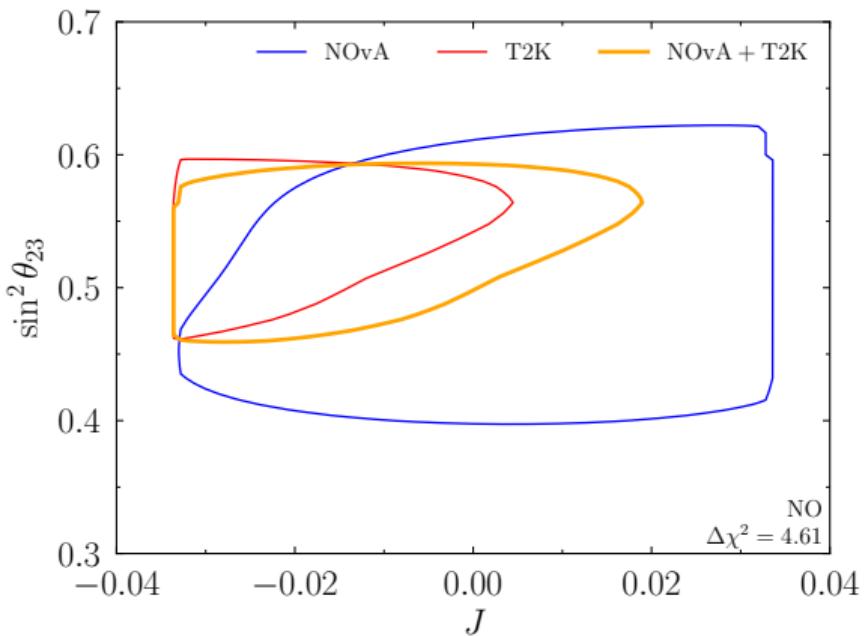

Looks like “large” CPV:

$$\sin \delta_{\text{PDG}} = 0.93 \sim 1$$

yet  $J_{\text{CKM}}/J_{\text{max}} = 3 \times 10^{-4}$ .

Switch to  $V_{212}$  parameterization,  $\Rightarrow \delta' = 1^\circ$  and  $\sin \delta' = 0.02$ .

# Standard oscillation parameters

Can see that the combination doesn't like the NO while it does like the IO  
IO preferred over NO at  $\Delta\chi^2 = 2.3$

# CP violation in oscillations

In vacuum at first maximum:

$$P_{\mu e} - \bar{P}_{\mu e} \approx 8\pi J \frac{\Delta m_{21}^2}{\Delta m_{32}^2}$$

$$J \equiv s_{12}c_{12}s_{13}c_{13}^2s_{23}c_{23} \sin \delta$$

C. Jarlskog [PRL 55, 1039 \(1985\)](#)

- ▶ Extracting  $\delta$  from data requires every other oscillation parameter
- ▶  $J$  requires only  $\Delta m_{21}^2$  (up to matter effects)

Matter effects are easily accounted for

$$\hat{J} \simeq \frac{J}{\sqrt{(c_{212} - c_{13}^2 a / \Delta m_{21}^2)^2 + s_{212}^2} \sqrt{(c_{213} - a / \Delta m_{ee}^2)^2 + s_{213}^2}}$$

[PBD](#), S. Parke [1902.07185](#)

[PBD](#), H. Minakata, S. Parke [1604.08167](#)

## When $\delta$ and when $J$ ?

If the goal is **CP violation** the Jarlskog invariant should be used

however

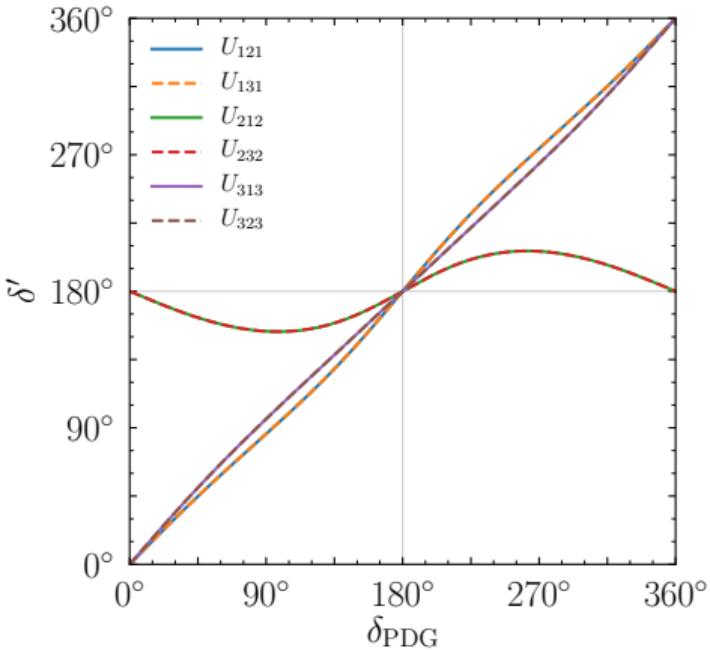

If the goal is **measuring the parameters** one must use  $\delta$

Given  $\theta_{12}$ ,  $\theta_{13}$ ,  $\theta_{23}$ , and  $J$ , I can't determine the sign of  $\cos \delta$  which is physical

e.g.  $P(\nu_\mu \rightarrow \nu_\mu)$  depends on  $\cos \delta$  a tiny bit

- ▶ T2K/HK are mostly sensitivity to  $\sin \delta$ ; they should focus on  $J$   
T2K does this now!
- ▶ NOvA/DUNE has modest  $\cos \delta$  sensitivity; both  $J$  and  $\delta$  should be reported

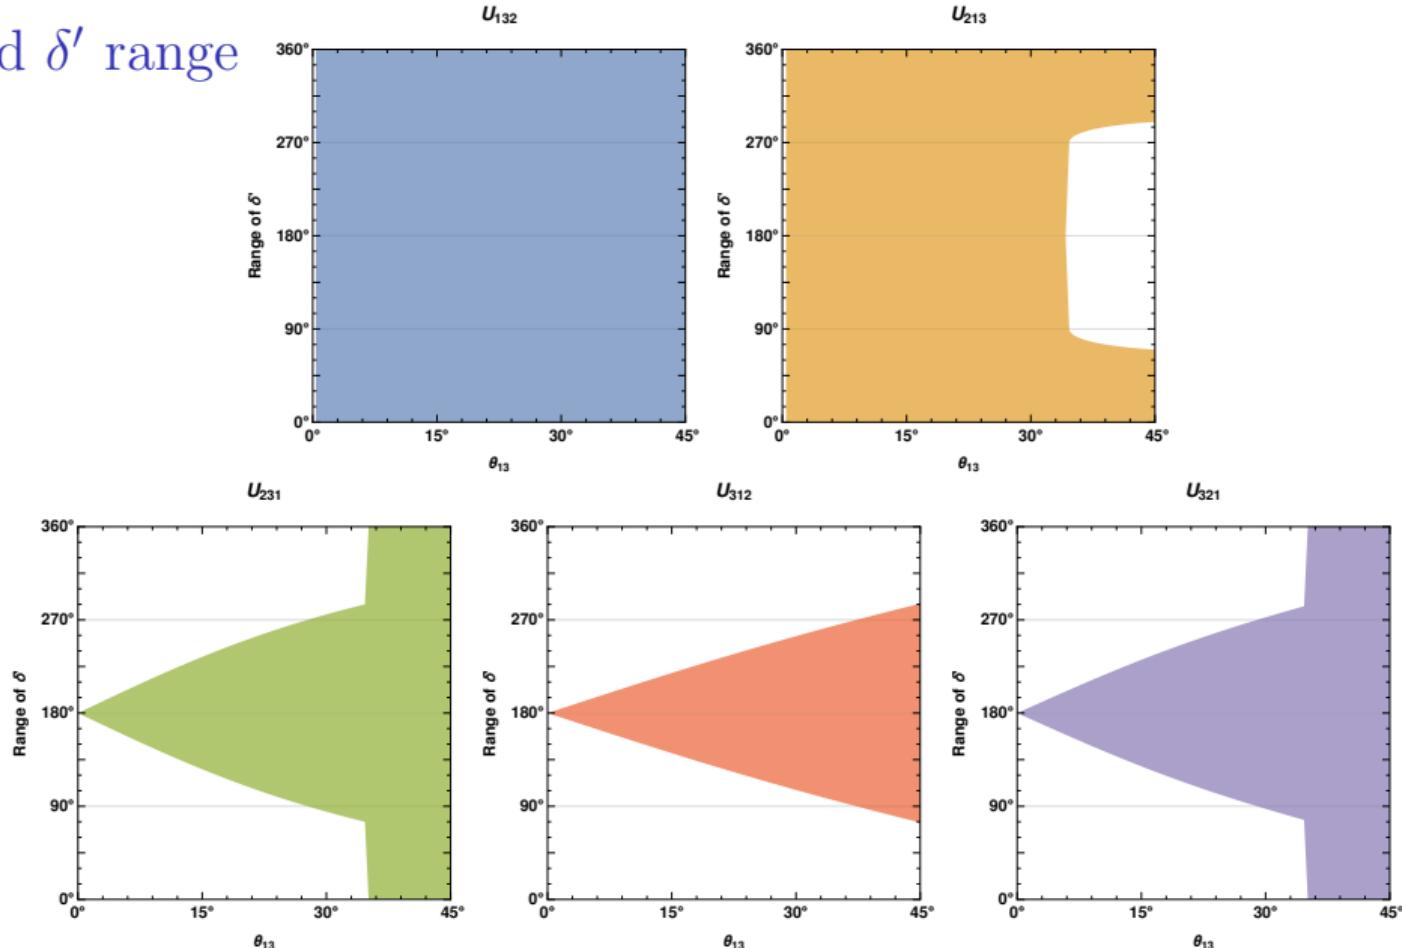

# Repeated rotations

	$U_{121}$	$U_{131}$	$U_{212}$	$U_{232}$	$U_{313}$	$U_{323}$
$ U_{e2} $	✓	✓	✓	✓	✗	✗
$ U_{e3} $	✓	✓	✗	✗	✓	✓
$ U_{\mu 3} $	✗	✗	✓	✓	✓	✓

Note that  $e^{i\delta}$  must be on first or third rotation

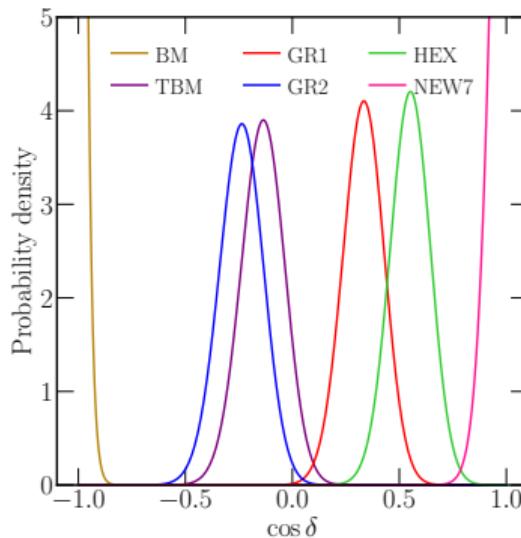

# Allowed $\delta'$ range

# The importance of $\cos \delta$

- ▶ If only  $\sin \delta$  is measured  $\Rightarrow$  sign degeneracy:  $\cos \delta = \pm \sqrt{1 - \sin^2 \delta}$
- ▶ Most flavor models predict  $\cos \delta$

J. Gehrlein, et al. [2203.06219](#)

L. Everett, et al. [1912.10139](#)

Stony Brook: October 18, 2022 59/48

## Unitarity violation

- ▶ Could conceivably differentiate: 2 new states from 1, but not 3+ from 2
- ▶ Zero distance effect  $\Rightarrow$  near detector **with flux prediction**

E.g. RAA, Gallium

- ▶ Numerous parameterizations:  $\alpha$  matrix,  $\eta$  matrix, submatrix & Cauchy-Schwartz  
All apply to the inaccessible cases only
- ▶ There is an approximate correspondence to sterile and NSI

$$\alpha_{ee} \approx \frac{1}{2}(s_{14}^2 + s_{15}^2 + s_{16}^2) \approx -\epsilon_{ee}, \quad \dots$$

M. Blennow, et al. [1609.08637](#)
